UNIVERSITY

## Bioanalytical Chemistry

### Research Interests

Bioanalytical chemistry is a branch of analytical chemistry specifically interested in measuring biological species, usually in complex samples of biological origin. Measuring these species allows an understanding of the biological processes and is critical in the Life Sciences. Our group develops and uses new analytical methods and tools to improve the quality and speed of the analysis. This includes developing new instrumentation, detection strategies and sample preparation methods. Our primary methods of analysis are capillary electrophoresis and capillary electrochromatography but mass spectrometry is becoming more important. We develop and characterize novel stationary phases for capillary electrochromatography using model biological systems. We also have on-going research interest and collaborations in using bioanalytical tools for the analysis of human amniotic fluid for the prediction of birth outcome.

### Selected Publications

- Duford, David A.; Lafleur, Josiane P.; Lam, Rebecca; Skinner, Cameron D.; Salin, Eric D. Induction heating-electrothermal vaporization for direct mercury determination in a single human hair by atomic fluorescence and atomic absorption spectrometry. *Journal of Analytical Atomic Spectrometry* (2007), 22(3), 326-329.
